

FORM VALIDATION

Form Validation | Activity

Create a simple web application that contains two forms: **Sign Up** and **Sign In**.

On the first page, the user must choose whether they want to Sign Up or Sign In (through two buttons), and then be redirected to the correct page.

Each form must include input validation using JavaScript before the form is submitted. For the Sign Up form, validate that the email is in a proper format, the phone number is filled, and the password is at least 8 characters long and contains a number. For the Sign In form, validate that both the email and password fields are not empty and that the email format is valid. Use event handling such as submit, input, and blur to show error messages and prevent the form from submitting if validation fails. If the form is valid, display a success message or redirect to a "Welcome" page.

For the Sign Up form, validate that the email is in a proper format, the phone number is filled, and the password is at least 8 characters long and contains a number.

For the Sign In form, validate that both the email and password fields are not empty and that the email format is valid.

Use event handling such as submit, input, and blur to show error messages and prevent the form from submitting if validation fails. If the form is valid, display a success message or redirect to a “Welcome” page.

Note: Output with better CSS design will gain 15 extra points.
